## SUMMARY

Unleaded, automotive, winter grade gasolines, both regular (type 2) and super (type 1), sold in the Ottawa/Hull area by the major oil companies are all excellent in quality, meeting requirements of CGSB\* Standards 3-GP-5 and 3-GP-5Ma for Unleaded Automotive Gasoline.

All the tested gasolines have nil or negligible lead and phosphorus contents indicating excellent protection against catalyst poisoning. Most gasolines have manganese, probably as the methylcyclopentadienyl manganese tricarbonyl antiknock agent.

\* Canadian Government Specifications Board

## RÉSUMÉ

Les essences auto de type sans plomb, régulier (type 2) et super (type 1), vendues dans la région Ottawa/Hull et distribuées par les principales compagnies pétrolières sont d'excellente qualité se conformant aux normes 3-GP-5 et 3-GP-5Ma de la ONGC\* pour essence auto type sans plomb.

La quantité de plomb et de phosphore contenue dans toutes les essences analysées est inexistante ou négligeable assurant une excellente protection contre l'empoisonnement du catalyseur. La plupart des essences contiennent du manganèse, probablement sous forme de tricarbonyl méthylcyclopentadienyl de manganèse, agent antidétonnant.

## PROPERTIES OF REGULAR AND SUPER UNLEADED AUTOMOTIVE GASOLINES (OTTAWA/HULL AREA - WINTER, 1978/79)

### 1.0 INTRODUCTION

This survey of the physical, chemical and antiknock properties of unleaded automotive gasolines sold by the major oil companies in the Ottawa/Hull area in the winter of 1978/79 was made for two reasons: (1) To obtain data on unleaded gasolines used in the Environment Canada project employing cars in field service aimed at comparing the engine performance of two API service classification SE automotive oils, one formulated from virgin oil basestock and the other formulated from re-refined oil basestock (SAE viscosity grade: 20W-40). (2) To obtain and disseminate more widely this useful data on unleaded gasolines because of its general unavailability.

### 2.0 SAMPLES

One gallon quantities of each of fifteen unleaded automotive gasolines (8 regular and 7 super) were obtained from eight major oil company service stations in the Ottawa/Hull area in late February 1979. As the gasolines probably came from Quebec refineries, principally in Montreal, they are accordingly probably representative of gasolines sold in the Montreal/Quebec City as well as Ottawa/Hull region. Care was taken to ensure that the samples were uncontaminated and promptly capped to minimize vapour losses. Subsequently, they were stored in a refrigerator in the NRC Fuels and Lubricants Laboratory maintained at 32-40°F before testing, the Reid vapour pressure being determined first.

### 3.0 OIL COMPANIES

The unleaded winter gasolines, as noted, were obtained from the service stations of eight different oil companies. The oil companies are listed in alphabetical order. This order is unrelated to the order, or sample numbers shown in the Tables.

BP Canada  
Golden Eagle Canada Limited  
Gulf Oil Canada Limited  
Imperial Oil Limited  
Petrofina Canada Limited  
Shell Canada Limited  
Sun Oil Company Limited  
Texaco Canada Limited

Seven oil company service stations dispensed both grades of unleaded gasoline. One of the company stations dispensed only the regular grade.

### 4.0 TESTS AND RESULTS

Tests performed on the unleaded gasolines were in all instances ASTM laboratory tests as stated in CGSB Standards 3-GP-5 or 3-GP-5Ma for Unleaded Automotive Gasoline (Ref. 1). Tests used were the latest published versions of the tests except for (1) the sulphur content which was determined by an old version, D90-34T, and (2) the manganese content, D3831, which is in the final stages of approval in ASTM, but not yet published.

All tests specified in 3-GP-5 and 3-GP-5Ma were performed. In addition, though, for information, several additional tests were done and data recorded. These were (1) API gravity and relative

density, (2) hydrocarbon types, (3) evaporation residue as described in the gum test, and (4) research octane number.

Results of all tests are presented in four tables, two of which present the results in the new metric or SI units and the other two in the old non-metric or superseded units. For purposes of determining compliance with 3-GP-5 and 3-GP-5Ma specification limits, the limits are shown in the Tables.

The data are presented as follows:

Table 1 — Properties of Regular Unleaded Gasolines — Metric Units\*

Table 2 — Properties of Super Unleaded Gasolines — Metric Units.

Table 3 — Properties of Regular Unleaded Gasolines — Non-metric Units.

Table 4 — Properties of Super Unleaded Gasolines — Non-metric Units.

## 5.0 COMPLIANCE WITH CGSB SPECIFICATION 3-GP-5 (3-GP-5Ma)

An examination of the data in the four tables reveals that all of the unleaded automotive gasolines surveyed are of high quality. All meet all of the requirements of CGSB Specification 3-GP-5 or 3-GP-5Ma except for two super unleaded gasolines that appear to have a yellow rather than a green colour. Since this is a subjective test and the quality of the two gasolines is high and well within specification limits, the colour discrepancy is considered to have no effect on engine performance.

As noted both lead and phosphorus are either absent or present only in trace amounts in the gasolines indicating good protection for the anti-pollution catalyst. In large amounts, say in excess of the specification limits, both of these elements would soon destroy the catalyst. It is interesting to note that practically all unleaded gasolines, regular and super alike contain manganese as an antiknock agent, probably as methylcyclopentadienyl manganese tricarbonyl (MMT)\*. Sulphur levels are very low in all gasolines indicating good metal protection from corrosion due to sulphur combustion products.

All gasolines have good oxidation stability and negligible gum contents.

Most of the super, unleaded gasolines have a high antiknock quality. In comparison with premium leaded gasolines which reached an average high of about 100 research octane numbers in the Ottawa/Hull area a few years ago, (Refs. 2, 3, 4) the current super unleaded gasolines have an average of 98 (some being over 98.5) research octane numbers.

Two other notable differences between these unleaded gasolines and earlier leaded gasolines are (1) the higher aromatic contents of the unleaded gasolines obviously to maintain a high antiknock quality in the absence of tetraethyl lead, and (2) the lower distillation end points of the unleaded gasolines to minimize the emission of unburned hydrocarbons. Two earlier NRC reports show the properties of leaded gasolines in the Ottawa/Hull area (Refs. 3, 4).

## 6.0 ACKNOWLEDGEMENT

The authors acknowledge with thanks the research and motor octane number data provided by Messrs. J. O'Connor and J. Thompson of the Quality Engineering Test Establishment, DND.

Sulphur, % by mass	D90-34T	0.00	0.01	0.00	0.00	0.00	0.00	0.00	0.15 max.
Gum and Stability									
Evaporation Residue, mg/100mL	D381	2.7	4.2	4.2	2.2	3.7	6.8	7.5	No limit
Existent Gum, mg/100mL (4)	D381	1.4	1.1	1.0	0.4	1.0	2.2	1.7	7 max.
Oxidation Stability, min.	D525	> 240	> 240	> 240	> 240	> 240	> 240	> 240	240 min.
Anti-Knock Quality (6)									
Research Octane No. (R.O.N.)	D2699	98.0	98.6	98.4	97.0	97.5	98.7	98.6	No limit
Motor Octane No. (M.O.N.)	D2700	86.6	87.6	86.3	87.9	86.7	86.8	86.6	No limit
Anti-Knock Index	Note (5)	92.3	93.1	92.4	92.4	92.1	92.8	92.6	90.0 min.

NOTES: (1) Metric Specification 3-GP-5Ma for type 1 unleaded gasoline issued in November 1978.

Limits converted to non-metric units.

(2) During the visual examination the gasolines were examined for clarity and visible contaminants. All were clear. No visible contaminants were observed.

(3) Limit is 15 max. between November 1 and February 28, incl.

(4) Existent gum is the solvent-washed residue.

(5) R.O.N. plus M.O.N. divided by 2.

(6) Determined courtesy of the Knock Laboratory, QETE, DND.

<p>NRC, DME MP-73 National Research Council Canada. Division of Mechanical Engineering.</p> <p>PROPERTIES OF REGULAR AND SUPER UNLEADED AUTOMOTIVE GASOLINES (OTTAWA/HULL AREA - WINTER, 1978/79). Strigner, P.L., Moroz, G., Sabourin, R., Burton, G., Bailey, T. June 1979. 10 pp. (incl tables).</p> <p>Unleaded, automotive, winter grade gasolines, both regular (type 2) and super (type 1), sold in the Ottawa/Hull area by the major oil companies are all excellent in quality, meeting requirements of CGSB* Standards 3-GP-5 and 3-GP-5Ma for Unleaded Automotive Gasoline.</p> <p>All the tested gasolines have nil or negligible lead and phosphorus contents indicating excellent protection against catalyst poisoning. Most gasolines have manganese, probably as the methylcyclopentadienyl manganese tricarbonyl antiknock agent.</p> <p>* Canadian Government Specifications Board</p>	<p>NRC, DME MP-73 National Research Council Canada.
